NCAR

Atmospheric Oxygen

Thermodynamic Equilibrium

	ΔH_f kcal mol ⁻¹
Normal O ₂ molecules	0
Ozone, O ₃	34.1
Ground state atoms, O(³ P)	59.6
Excited atoms, O*(¹ D)	104.9

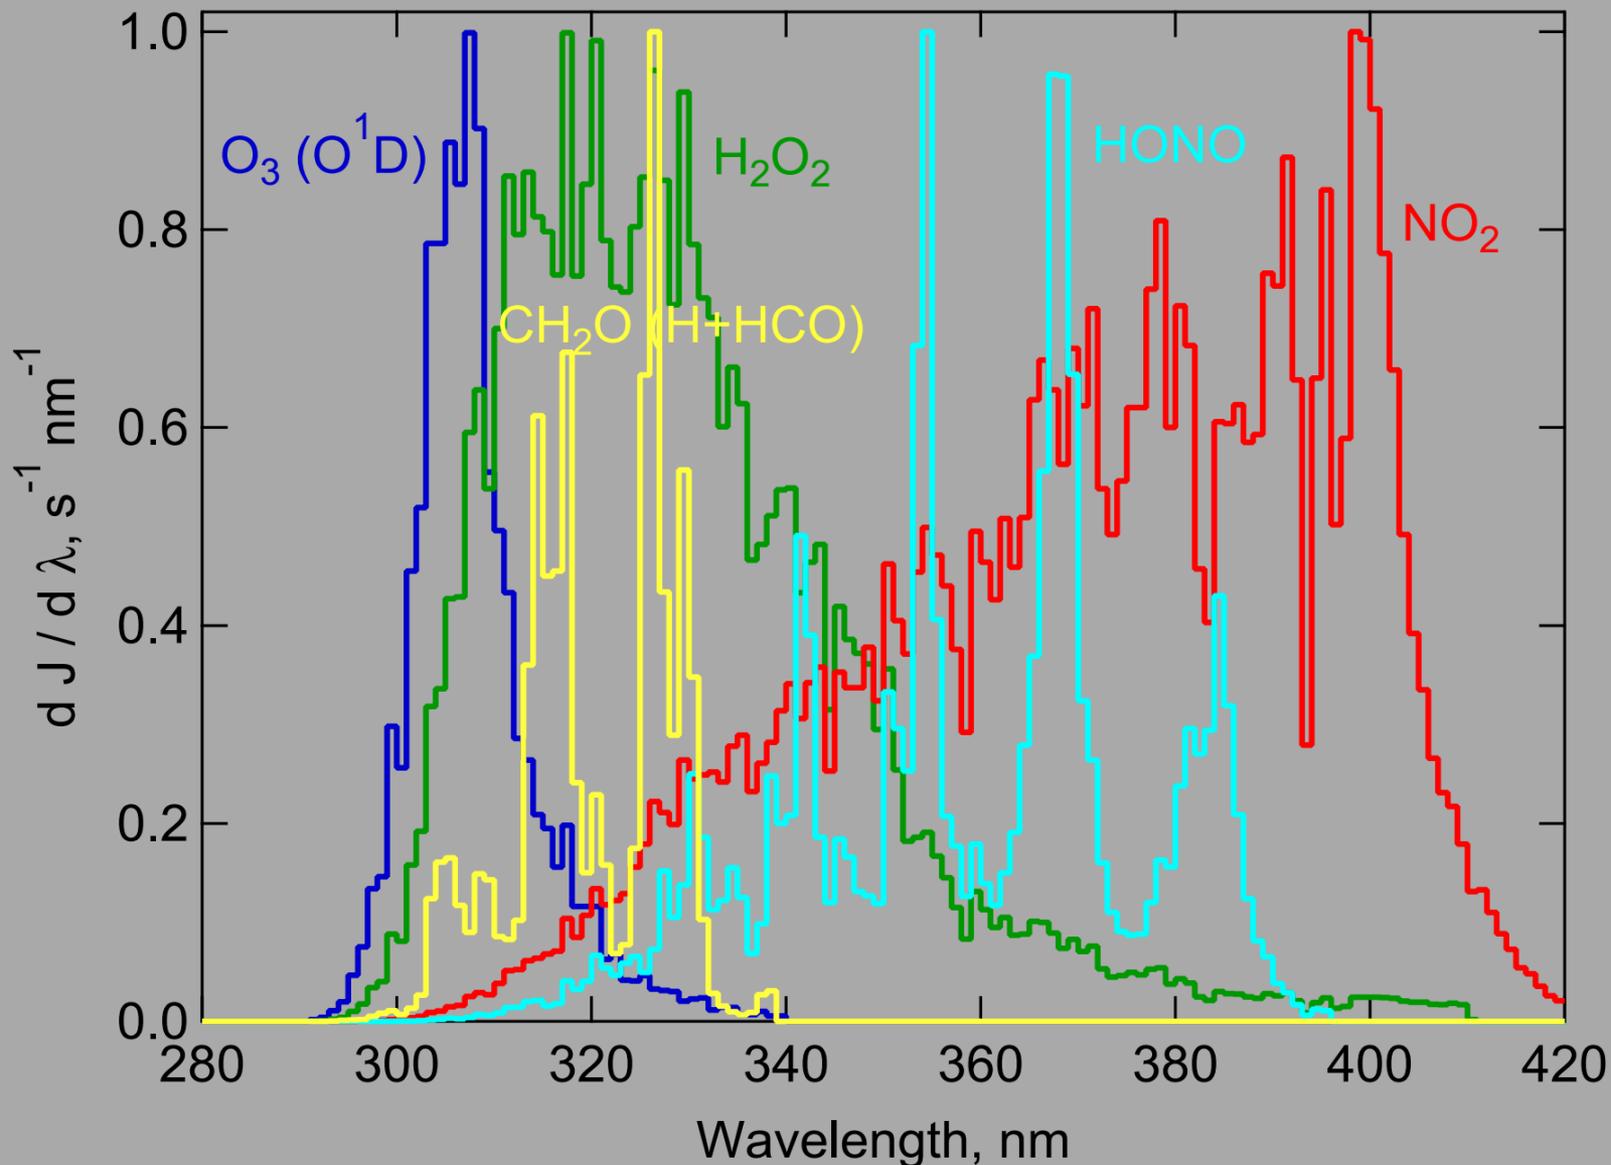

Some Important Photolysis Reactions

$\text{O}_2 + h\nu (\lambda < 240 \text{ nm}) \rightarrow \text{O} + \text{O}$	source of O_3 in stratosphere
$\text{O}_3 + h\nu (\lambda < 340 \text{ nm}) \rightarrow \text{O}_2 + \text{O}(^1\text{D})$	source of OH in troposphere
$\text{NO}_2 + h\nu (\lambda < 420 \text{ nm}) \rightarrow \text{NO} + \text{O}(^3\text{P})$	source of O_3 in troposphere
$\text{CH}_2\text{O} + h\nu (\lambda < 330 \text{ nm}) \rightarrow \text{H} + \text{HCO}$	source of HOx, everywhere
$\text{H}_2\text{O}_2 + h\nu (\lambda < 360 \text{ nm}) \rightarrow \text{OH} + \text{OH}$	source of OH in remote atm.
$\text{HONO} + h\nu (\lambda < 400 \text{ nm}) \rightarrow \text{OH} + \text{NO}$	source of radicals in urban atm.

UV-B and UV-A Wavelength: Range and Resolution for Tropospheric Chemistry

sea level, overhead sun, tuv5.2

Quantifying Photolysis Processes

Photolysis reaction: $AB + h\nu \rightarrow A + B$

Photolysis rates: $\left. \frac{d[AB]}{dt} \right|_{h\nu} = -J[AB]$

$$\left. \frac{d[A]}{dt} \right|_{h\nu} = \left. \frac{d[B]}{dt} \right|_{h\nu} = +J[AB]$$

Photolysis frequency (s^{-1}) $J = \int_{\lambda} F(\lambda) \sigma(\lambda) \phi(\lambda) d\lambda$

(other names: photo-dissociation rate coefficient, J-value)

CALCULATION OF PHOTOLYSIS COEFFICIENTS

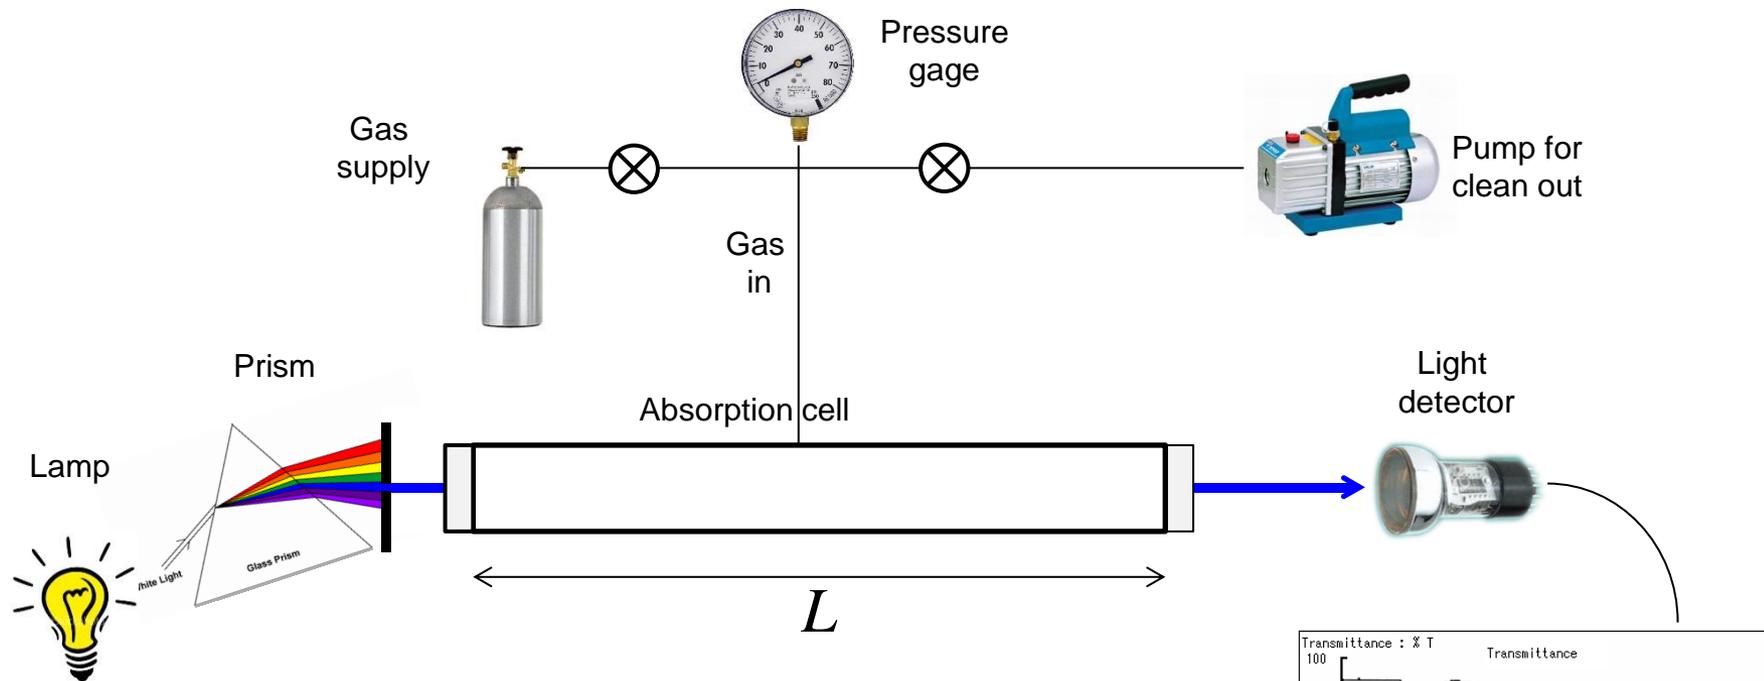

$$J (\text{s}^{-1}) = \int_{\lambda} F(\lambda) \sigma(\lambda) \phi(\lambda) d\lambda$$

$F(\lambda)$ = spectral actinic flux, quanta $\text{cm}^{-2} \text{s}^{-1} \text{nm}^{-1}$
 \propto probability of photon near molecule.

$\sigma(\lambda)$ = absorption cross section, $\text{cm}^2 \text{molec}^{-1}$
 \propto probability that photon is absorbed.

$\phi(\lambda)$ = photodissociation quantum yield, molec quanta $^{-1}$
 \propto probability that absorbed photon causes dissociation.

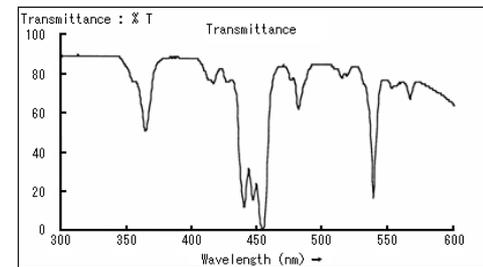

Measurement of Absorption Cross Section $\sigma(\lambda)$

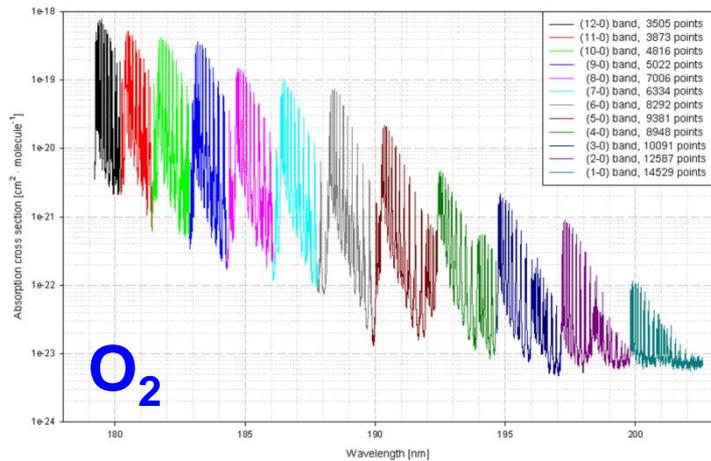

$$\text{Transmittance} = I / I_0 = \exp(-\sigma n L)$$

$$\sigma = -1/(nL) \ln(I / I_0)$$

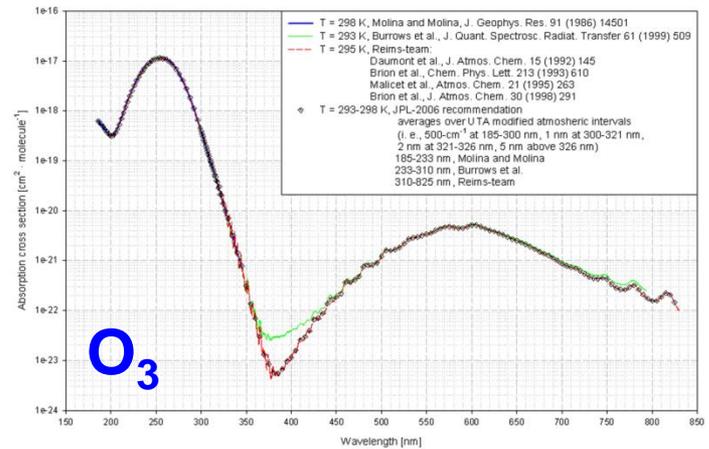

Easy: measure pressure ($n = P/RT$), and relative change in light: I / I_0

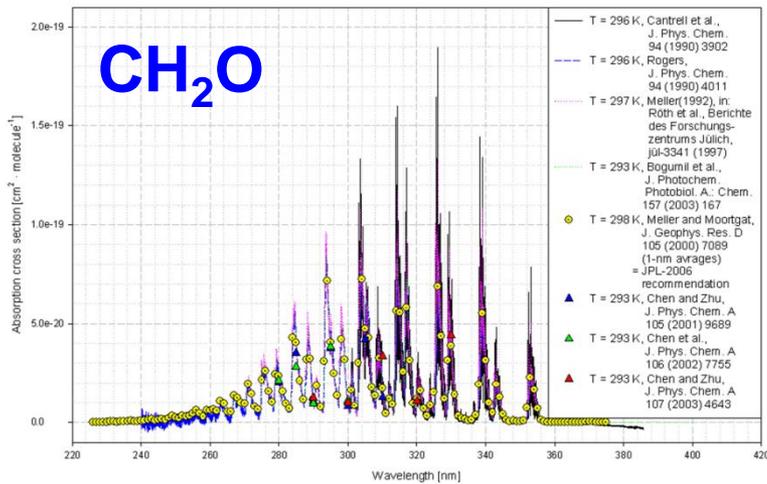

Absorption cross sections $\sigma(\lambda, T)$

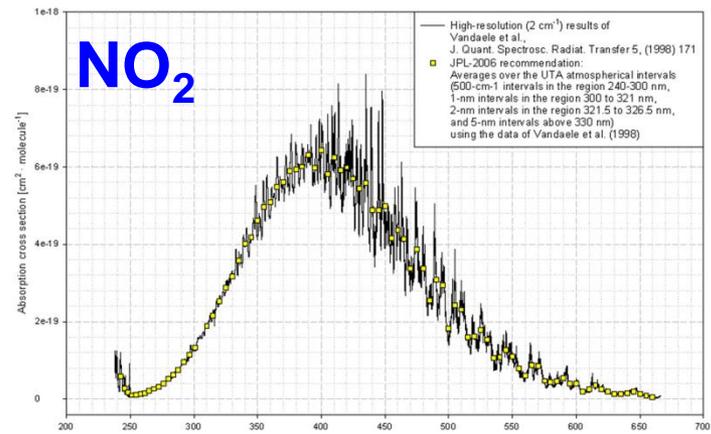

Absorption cross sections in the Schumann-Runge region of oxygen O_2 at 300 K, Yoshino et al., Planet. Space Sci. 40 (1992) 185

Absorption cross sections of ozone O_3 at room temperature Evaluation for JPL-2006 recommendation

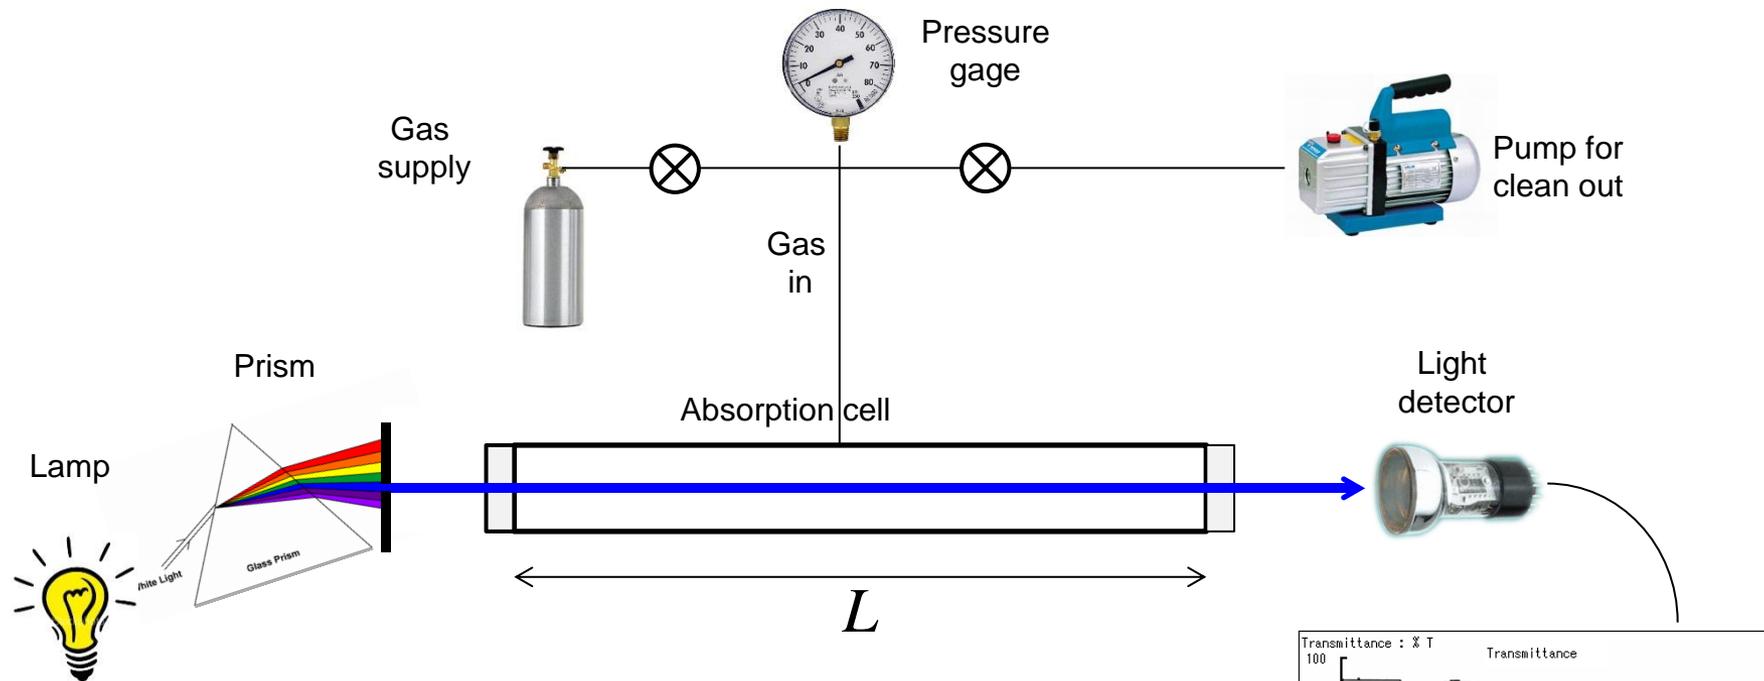

Absorption cross sections of formaldehyde CH_2O at room temperature (results 1990-2003)

Absorption cross sections of nitrogen dioxide NO_2 at 294 K Results from the year 1998 and JPL-2006 recommendation

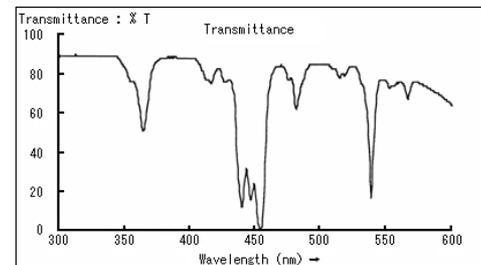

Measurement of Quantum Yields $\phi(\lambda)$

$$\text{Transmittance} = I / I_0 = \exp(-\sigma n L)$$

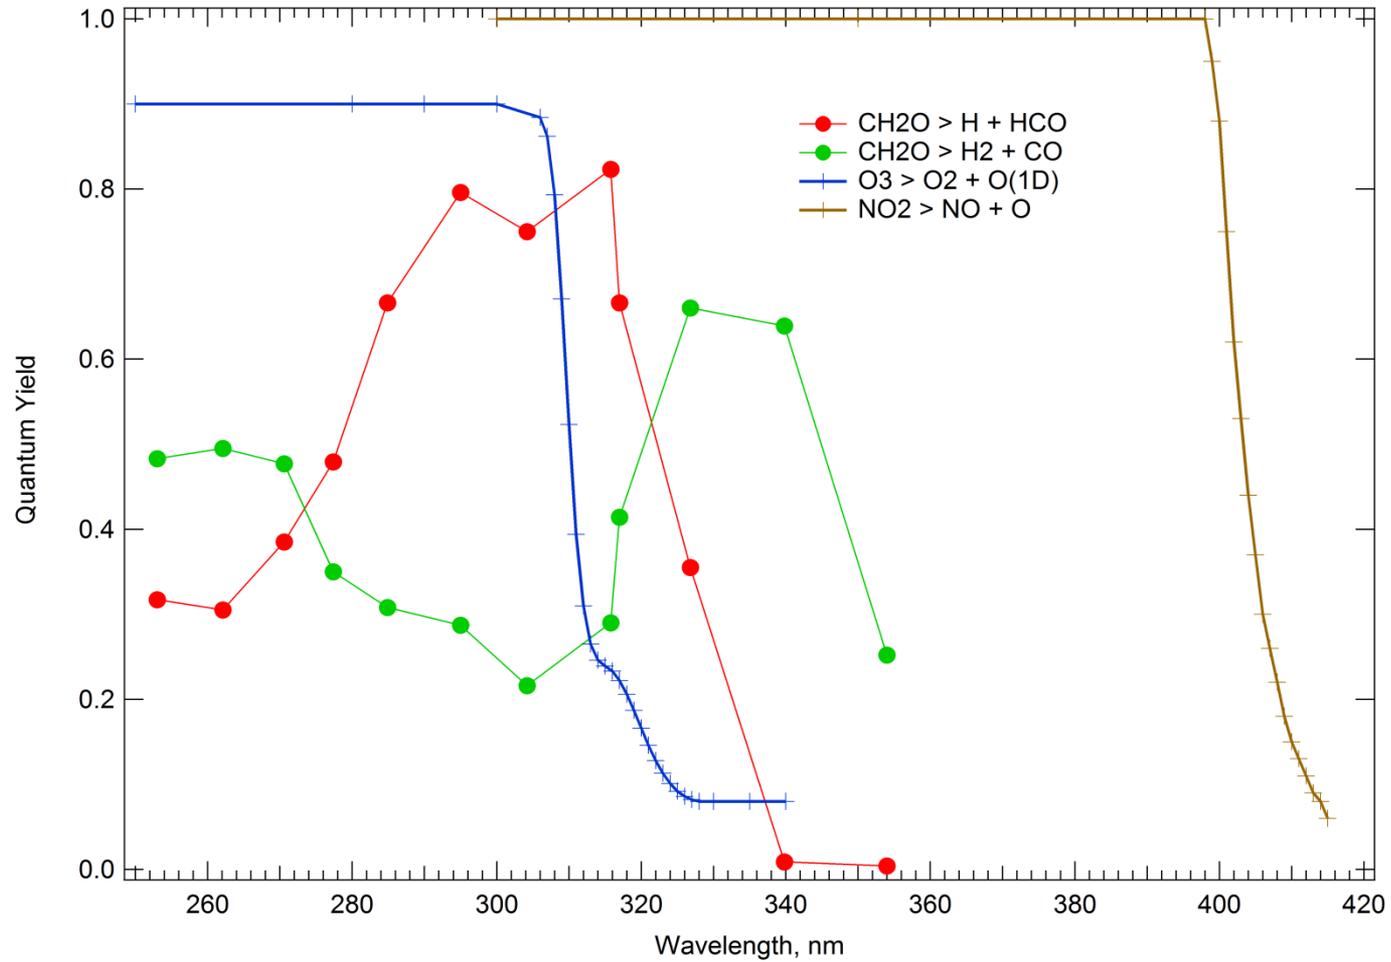

Quantum Yield = number of breaks per photon absorbed

$$\phi = \Delta n / \Delta I$$

Difficult: must measure absolute change in n (products) and I (photons absorbed)

Photo-dissociation Quantum Yields $\phi(\lambda, T, P)$

Compilations of Cross Sections & Quantum Yields

MPI-Mainz-UV-VIS Spectral Atlas of Gaseous Molecules

A Database of Atmospherically Relevant Species, Including Numerical Data and Graphical Representations

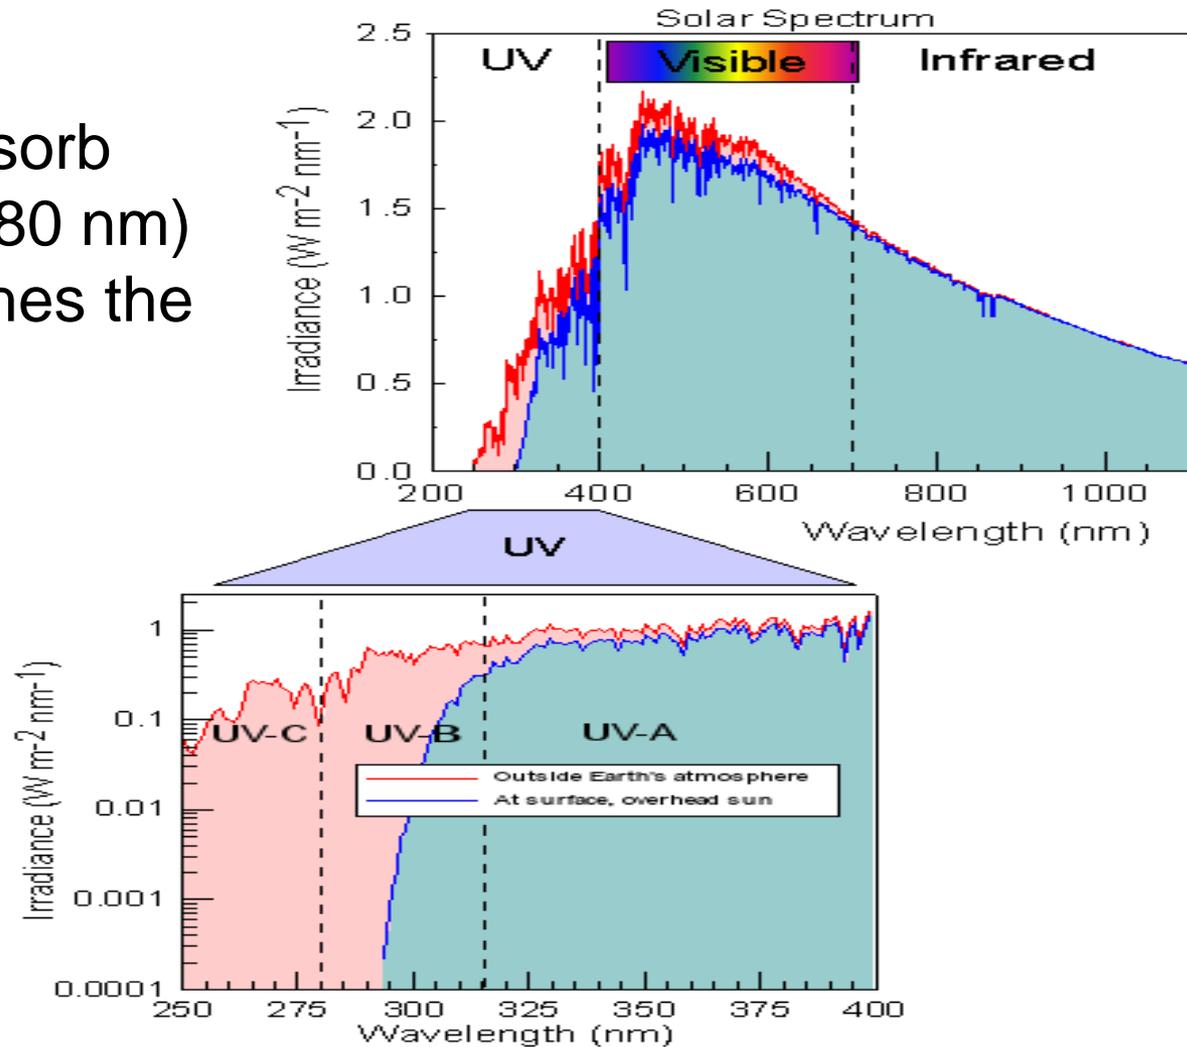

Hannelore Keller-Rudek, Geert K. Moortgat
Max-Planck-Institut für Chemie, Atmospheric Chemistry Division, Mainz, Germany

<http://jpldataeval.jpl.nasa.gov/>

The image shows the header and navigation menu of the NASA/JPL Data Evaluation website. The header includes the NASA logo, the text 'Jet Propulsion Laboratory California Institute of Technology', a link '+ View the NASA Portal', and a search bar labeled 'Search JPL'. Below the header is a navigation menu with five tabs: 'JPL HOME', 'EARTH', 'SOLAR SYSTEM', 'STARS & GALAXIES', and 'TECHNOLOGY'. The main content area features a large graphic with the NASA logo, a sun, a satellite, and the text 'NASA/JPL Data Evaluation' and 'Jet Propulsion Laboratory California Institute of Technology'. The graphic also includes several 'O₂' labels.

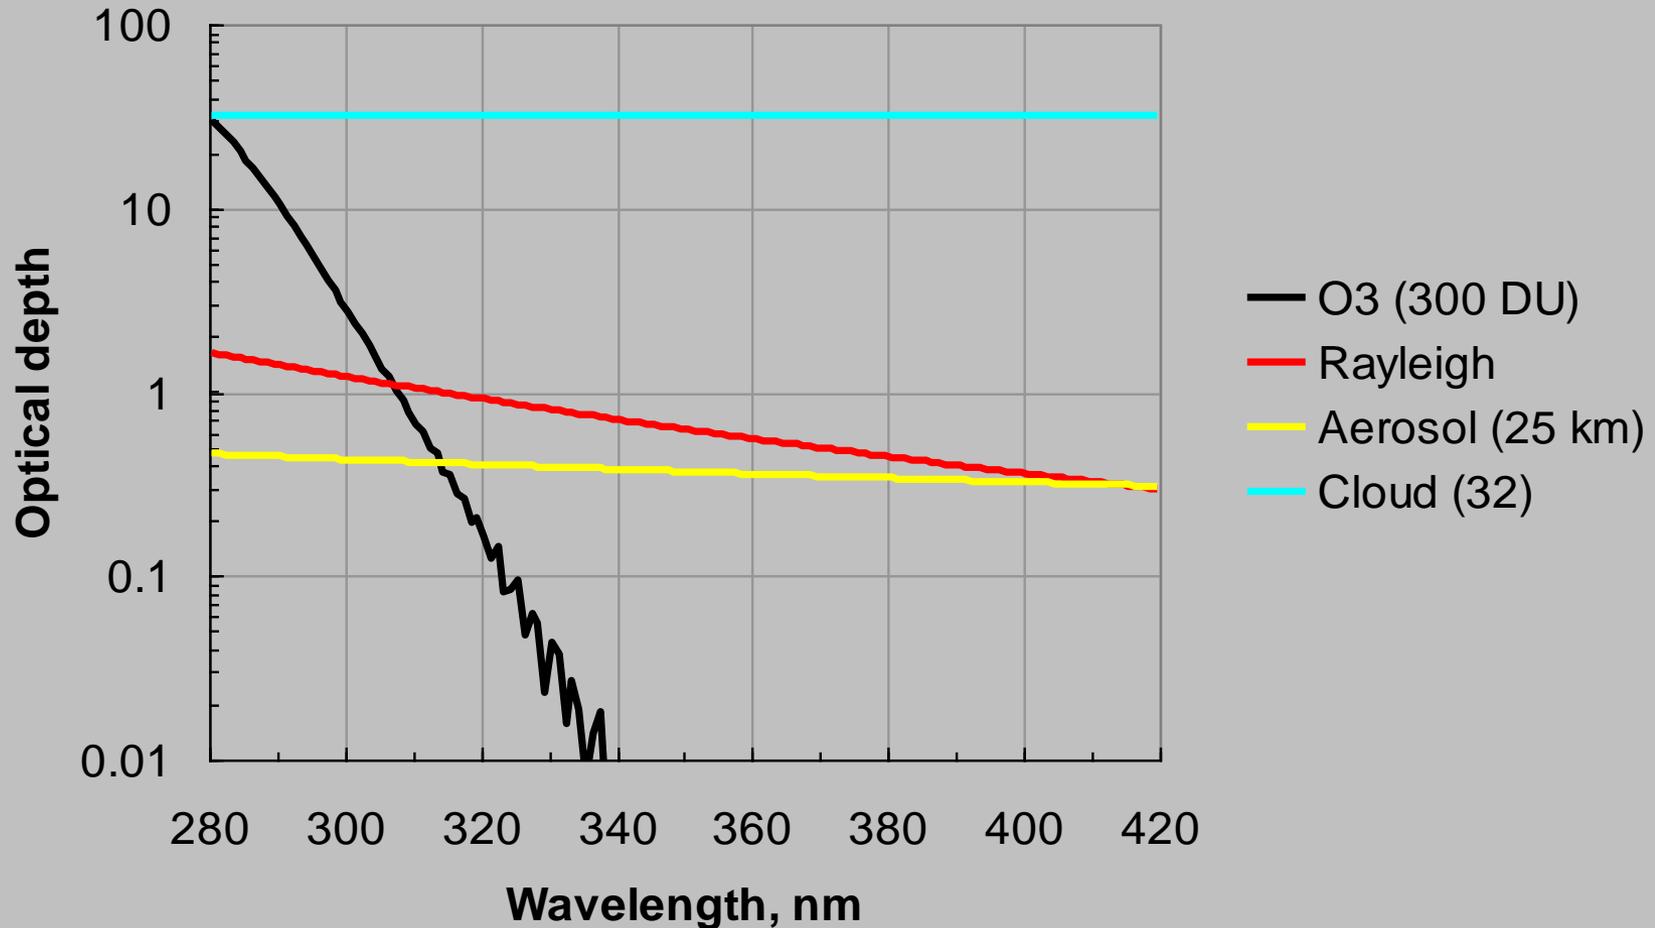

Solar Spectrum

O₂ and O₃ absorb all UV-C ($\lambda < 280$ nm) before it reaches the troposphere

Atmospheric Optical Depths, τ

defined by Transmission of a vertical beam = $\exp(-\tau)$

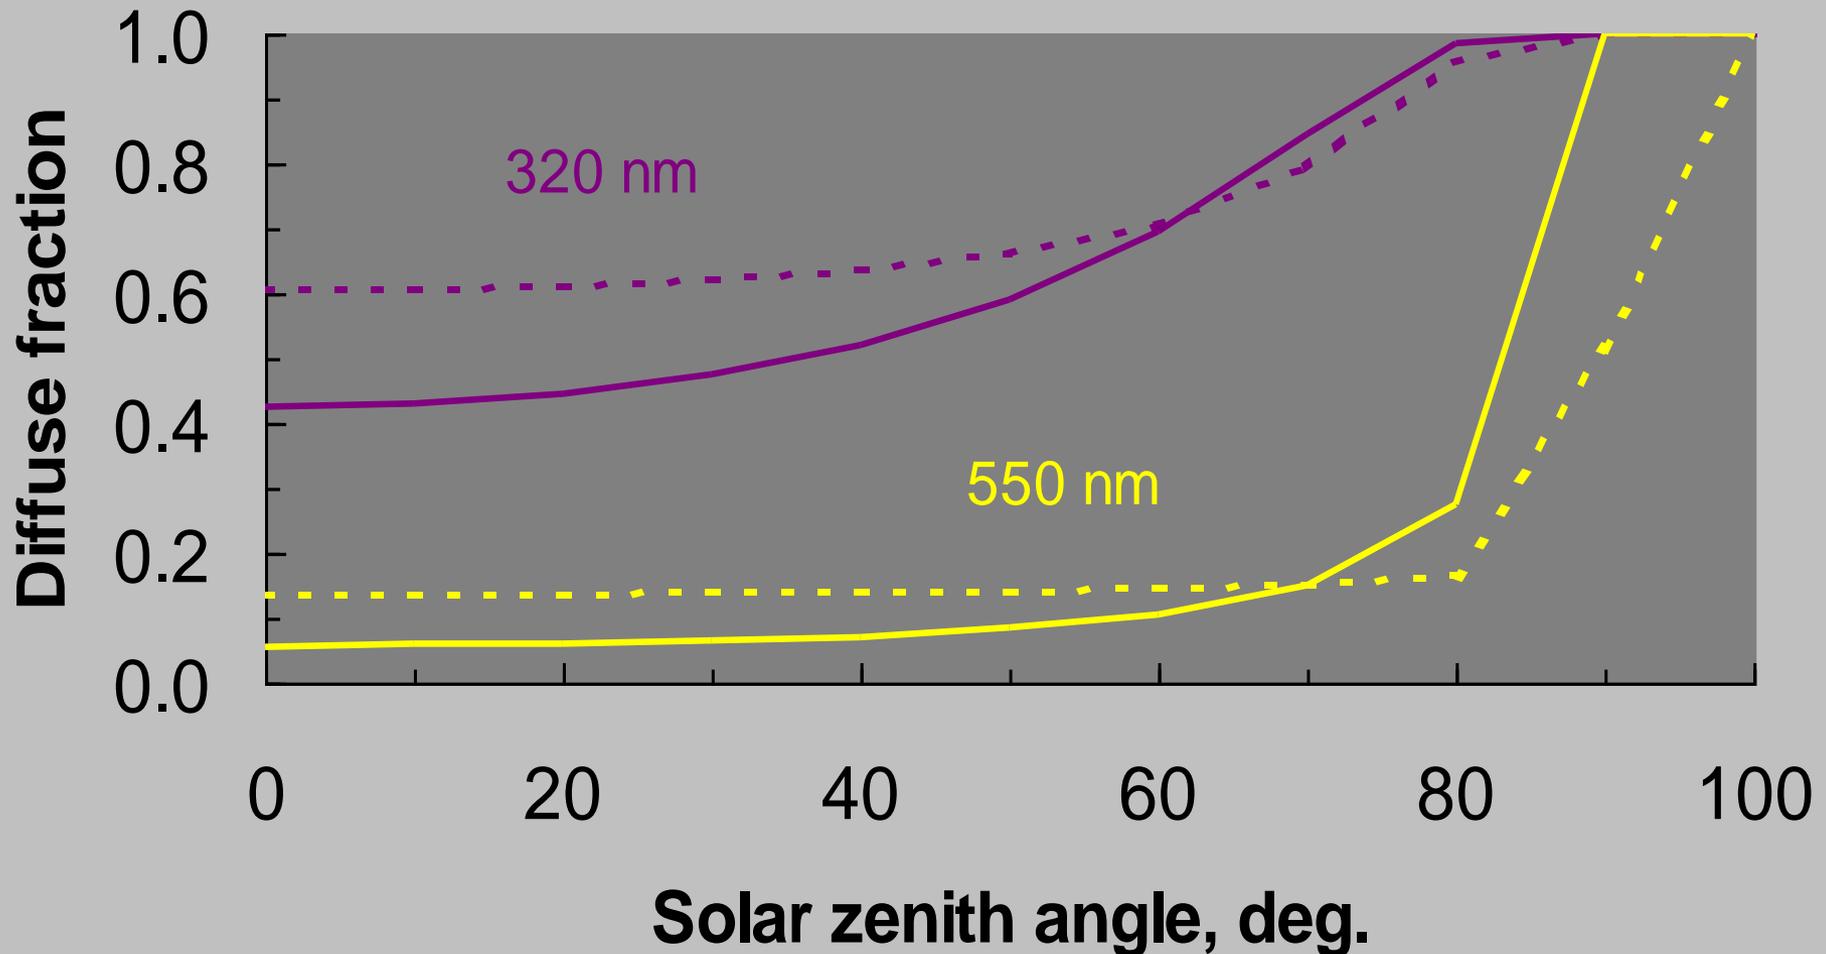

Diffuse transmission can be much larger

UV: Diffuse Radiation \geq Direct Solar Beam

clean skies, sea level

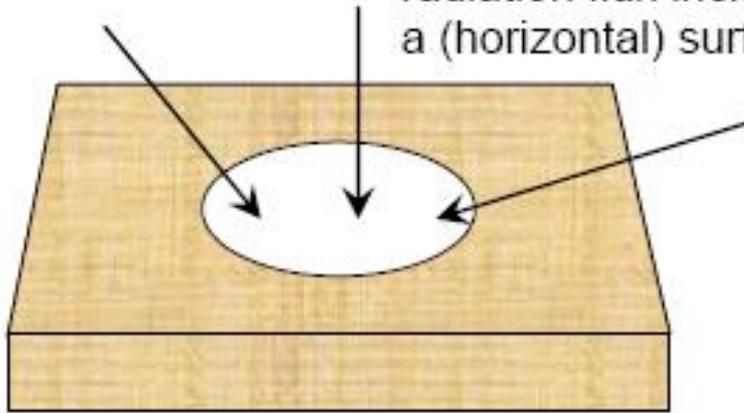

— Irradiance

- - - Actinic flux

INTEGRALS OVER ANGULAR INCIDENCE

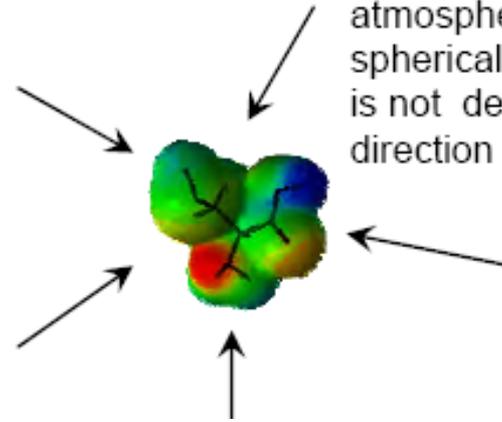

Irradiance: The radiation flux incident on a (horizontal) surface.

$$E = \int_0^{\pi} \int_0^{2\pi} I(\theta, \varphi) \cos \theta \sin \theta \, d\theta \, d\varphi$$

Watts m⁻²

Actinic flux: The photochemically active radiation flux in the earth's atmosphere. This flux is spherically integrated and is not dependent the direction of the radiation.

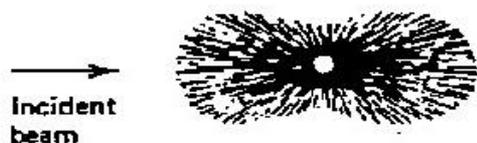

$$F = \int_0^{\pi} \int_0^{2\pi} I(\theta, \varphi) \sin \theta \, d\varphi \, d\theta$$

Watts m⁻² or quanta s⁻¹ cm⁻²

SCATTERING PHASE FUNCTIONS

$$P(\theta, \phi; \theta', \phi')$$

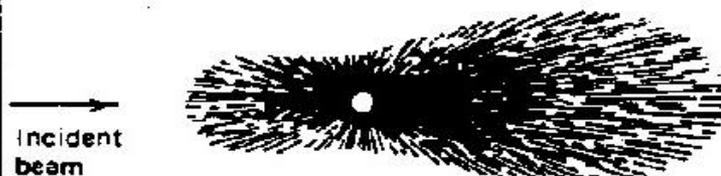

Small Particles (a)

Incident beam

Size: smaller than one-tenth the wavelength of light
Description: symmetric

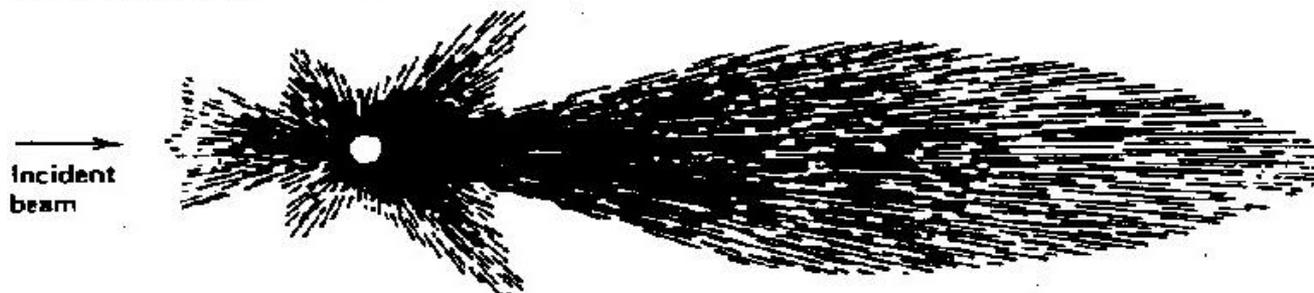

Large Particles (b)

Incident beam

Size: approximately one-fourth the wavelength of light
Description: scattering concentrated in forward direction

Larger Particles (c)

Incident beam

Size: larger than the wavelength of light
Description: extreme concentration of scattering in forward direction; development of maxima and minima of scattering at wider angles

The Radiative Transfer Equation

Propagation derivative

*Beer-Lambert
attenuation*

*Scattering from
direct solar beam*

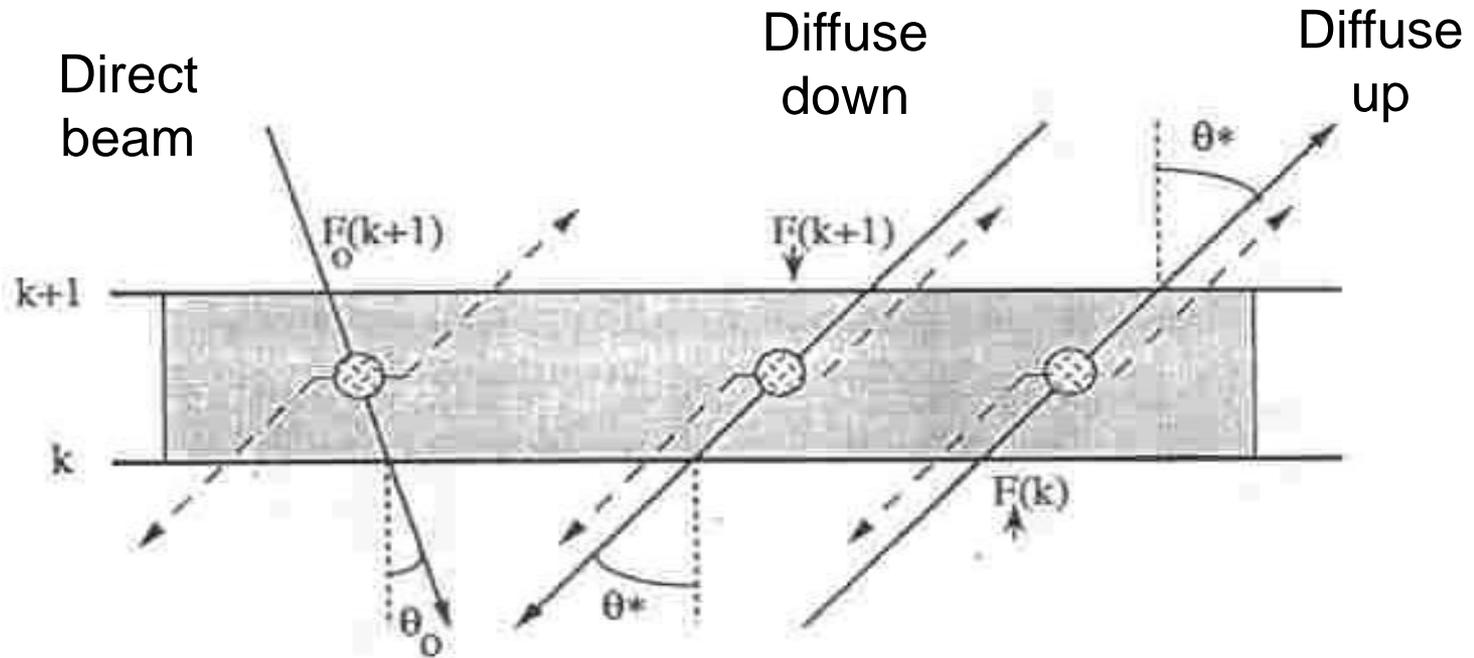

$$\cos \theta \frac{dI(\tau, \theta, \phi)}{d\tau} = -I(\tau, \theta, \phi) + \frac{\omega_o}{4\pi} F_\infty e^{-\tau/\cos \theta_o} P(\theta, \phi; \theta_o, \phi_o) + \frac{\omega_o}{4\pi} \int_0^{2\pi} \int_{-1}^{+1} I(\tau, \theta', \phi') P(\theta, \phi; \theta', \phi') d \cos \theta' d\phi'$$

*Scattering from diffuse light
(multiple scattering)*

NUMERICAL SOLUTIONS TO RADIATIVE TRANSFER EQUATION

- **Discrete ordinates**
n-streams ($n = \text{even}$), angular distribution exact as $n \rightarrow \infty$ but speed $\propto 1/n^2$
- **Two-stream family**
delta-Eddington, many others
very fast but not exact
- **Monte Carlo**
slow, but ideal for 3D problems
- **Others**
matrix operator, Feautrier, adding-doubling, successive orders, etc.

Two-stream methods

Multiple atmospheric layers, each assumed to be homogeneous
Must specify three optical properties:

Optical depth, $\Delta\tau$

Single scattering albedo, $\omega_0 = \text{scatt.}/(\text{scatt.}+\text{abs.})$

Asymmetry factor, g : *forward fraction* $\sim (1+g)/2$

For each layer, must specify $\Delta\tau$, ω_o , g :

1. Vertical optical depth, $\Delta\tau(\lambda, z) = \sigma(\lambda, z) n(z) \Delta z$

for molecules: $\Delta\tau(\lambda, z) \sim 0 - 30$

Rayleigh scatt. $\sim 0.1 - 1.0 \sim \lambda^{-4}$

O₃ absorption $\sim 0 - 30$

for aerosols: 0.01 - 5.0

Mie scatt. $\Delta\tau(\lambda, z) \sim \lambda^{-\alpha}$

($\alpha = \text{Angstrom exponent}$)

for clouds: 1-1000

$\alpha \sim 0$

cirrus $\sim 1-5$

cumulonimbus $\sim > 100$

For each layer, must specify $\Delta\tau$, ω_o , g :

2. Single scattering albedo, $\omega_o(\lambda, z) = \text{scatt.}/(\text{scatt.}+\text{abs.})$

range 0 - 1

limits: pure scattering = 1.0

pure absorption = 0.0

for molecules, strongly λ -dependent, depending on absorber amount, esp. O_3

for aerosols:

sulfate ~ 0.99

soot, organics ~ 0.8 or less,

not well known but probably higher

at shorter λ , esp. in UV

for clouds: typically 0.9999 or larger (vis and UV)

For each layer, must specify $\Delta\tau$, ω_o , g :

3. Asymmetry factor, $g(\lambda, z)$ = first moment of phase function

range -1 to + 1

pure back-scattering = -1

isotropic or Rayleigh = 0

pure forward scattering = +1

$$g = \frac{1}{2} \int_{-1}^{+1} P(\Theta) \cos \Theta d(\cos \Theta)$$

strongly dependent on particle size

for aerosols:, typically 0.5-0.7

for clouds, typically 0.7-0.9

*Mie theory for spherical particles: can compute $\Delta\tau$, ω_o , g
from knowledge of λ , particle radius and complex index of refraction*

Mie Scattering Theory

For spherical particles, given:

Complex index of refraction: $n = m + ik$
(composition-dependent)

Size parameter: $\alpha = 2\pi r / \lambda$

Can compute:

Extinction efficiency $Q_e(\alpha, n) \times \pi r^2$

Scattering efficiency $Q_s(\alpha, n) \times \pi r^2$

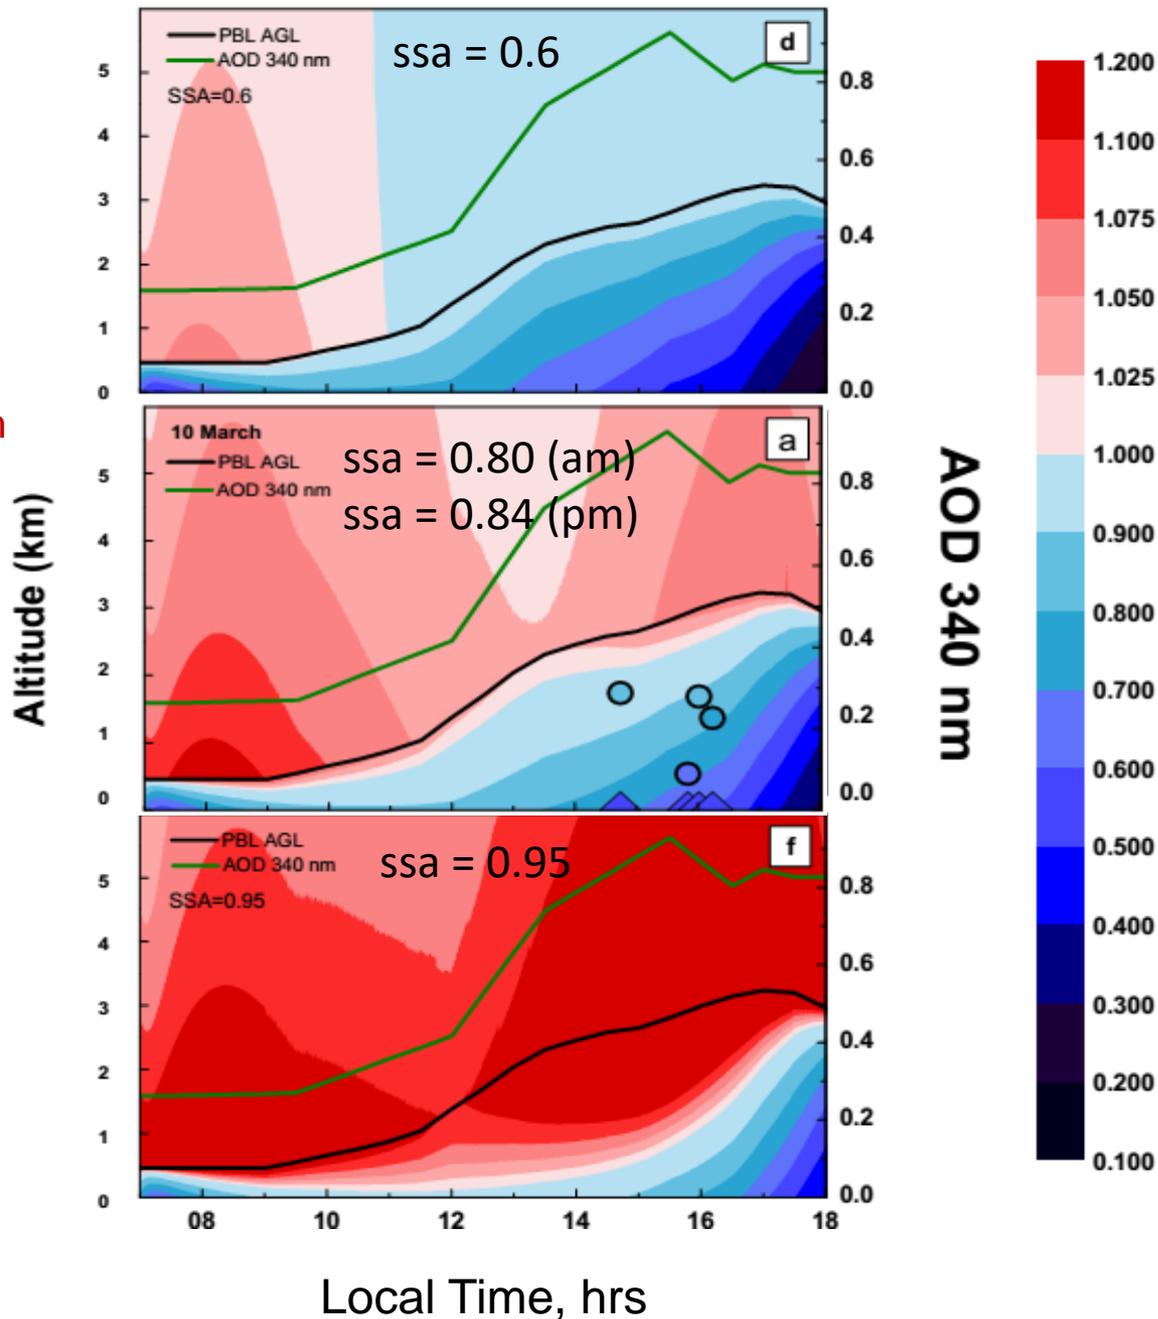

Phase function $P(\Theta, \alpha, n)$
or asymmetry factor $g(\alpha, n)$

Vertical Profile is Very Sensitive to Single Scattering Albedo

Mexico City suburbs (T1) March 2006

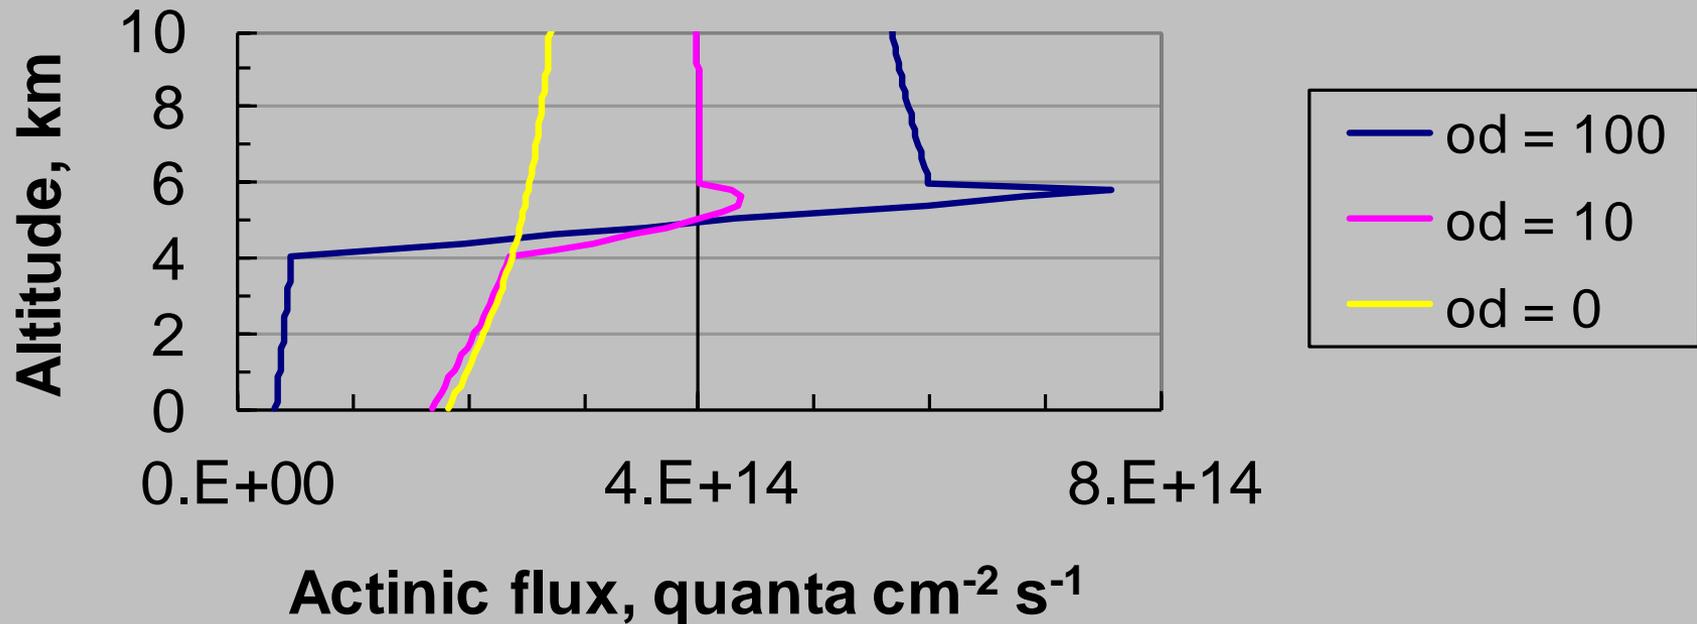

Central panel: Model with observed ssa, and obs.

Upper and lower panels: Sensitivity to ssa

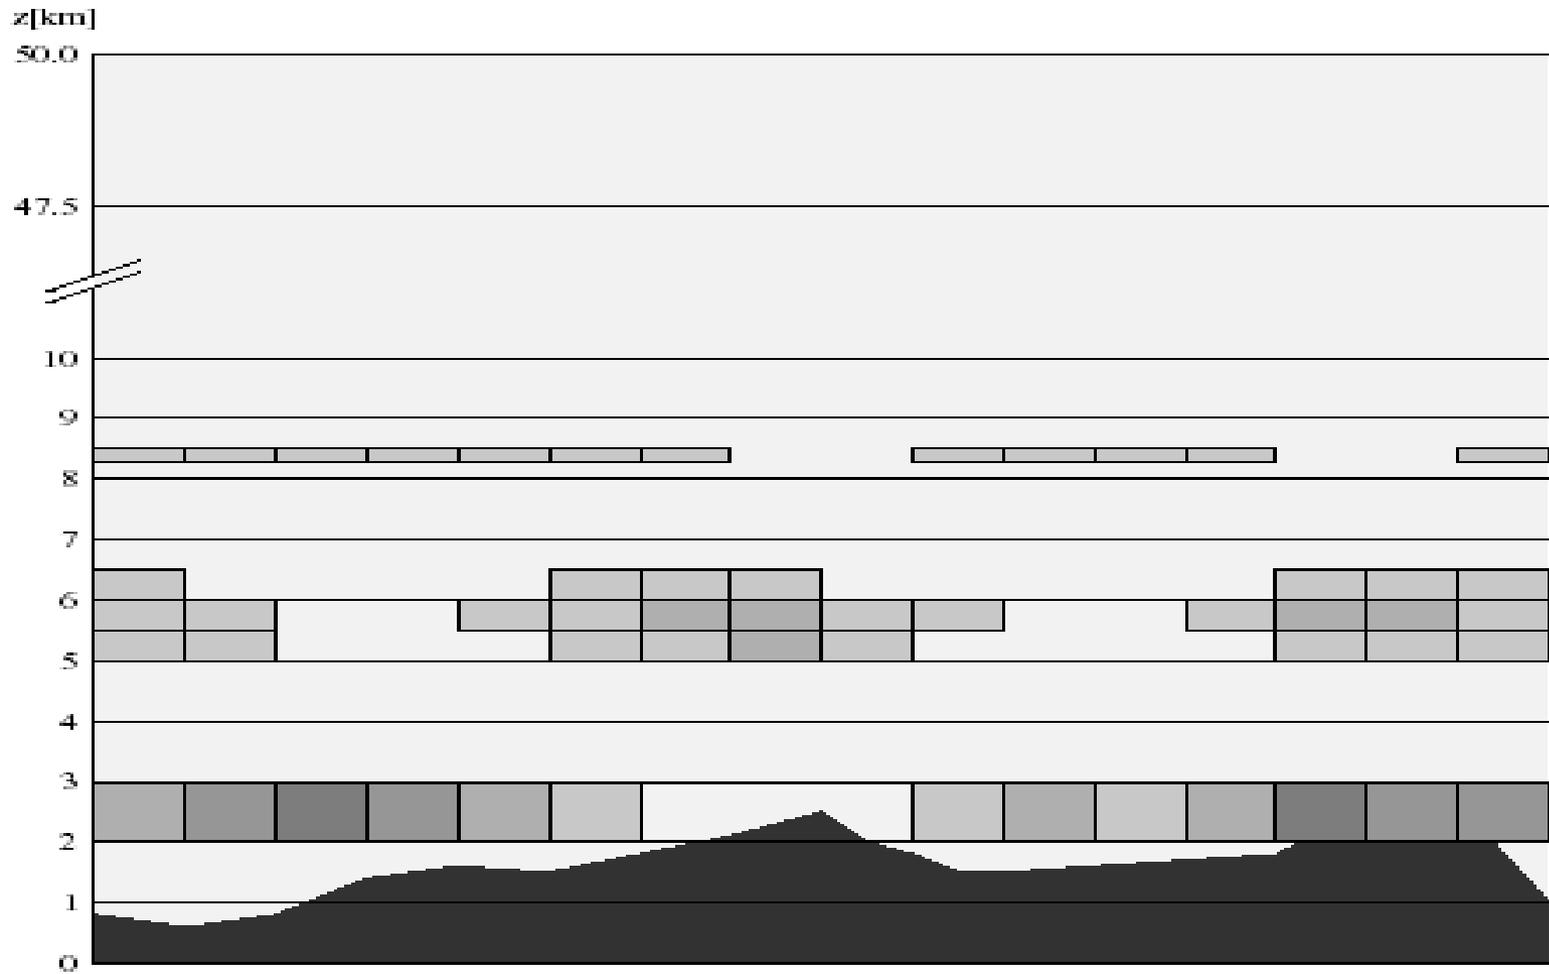

EFFECT OF UNIFORM CLOUDS ON ACTINIC FLUX

**340 nm, sza = 0 deg.,
cloud between 4 and 6 km**

In liquid spheres, multiply by ~ 1.6

Broken Clouds

Photolysis in WRF-Chem

- Several radiative transfer options:

- phot_opt = 1 : TUV (140 λ s, delta-Eddington)
- phot_opt = 2 : Fast-J (17 λ s, 8-str Feautrier)
- phot_opt = 3 : F-TUV (17 λ s, correction factor, delta-Eddington)

New option in WRF-Chem v3.9:

- ⇒ phot_opt = 4: updated TUV (140 λ s, delta-Eddington)
- ⇒ only works with MOZART_MOSAIC_4BIN_KPP, MOZART_MOSAIC_4BIN_AQ_KPP, and MOZCART_KPP chemical options

- Limitations & advantages

- Cross section and quantum yield data are hard-coded and not up to date in older schemes;
- ⇒ updated database to the latest TUV model (V5.3, Oct. 2016)
- Difficult to add new reactions (typically available ~ 20)
- ⇒ 109 reactions relevant for tropo & strato chemistry (e.g. halogens)

List of available photolysis reactions in the updated TUV

1	$O_2 \rightarrow O + O$	(J_o2)	31	$1-C_4H_9ONO_2 \rightarrow 1-C_4H_9O + NO_2$

Photolysis in WRF-Chem

- Ozone column density above the model top:
 - TUV: specified value above the model top (specified_du=325)
 - fast-J: specified value at the model top for the whole domain
 - f-TUV: MOZART model climatology at the top (input file exo_coldens.nc)
 - **New TUV: uses ozone climatology distributed from model top to 50km, and then several options available above 50km**
- Cloud optical properties:
 - Recalculated in each photolysis scheme, different from physics (e.g. RRTMG)
 - typically, COD calculated from LWP/IWP and effective drop radius (Slingo 1989, with fixed SSA = 0.9999 and $f_{\text{assym}} = 0.85$)
 - Various treatments of Sub-grid cloud overlap
 - Scaled by cloud fraction (fast-J)
 - Max random overlap for f-TUV (expensive)
 - Simplified ($\text{COD}_{\text{subgrid}} = \text{COD} * \text{FCLD}^{3/2}$, equivalent to max random overlap)
- Aerosols:

accounted for through the namelist option **aer_ra_feedback = .true.**

Settings for phot_opt = 4 (default in red)

Download the data file [TUV.phot.tar](#) from the ACOM website
(add data directories DATAE1 and DATAJ1, and wrf_tuv_xsqr.nc file)

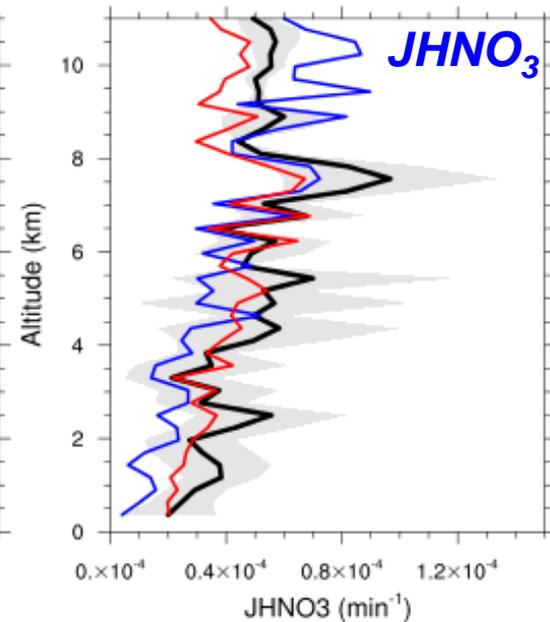

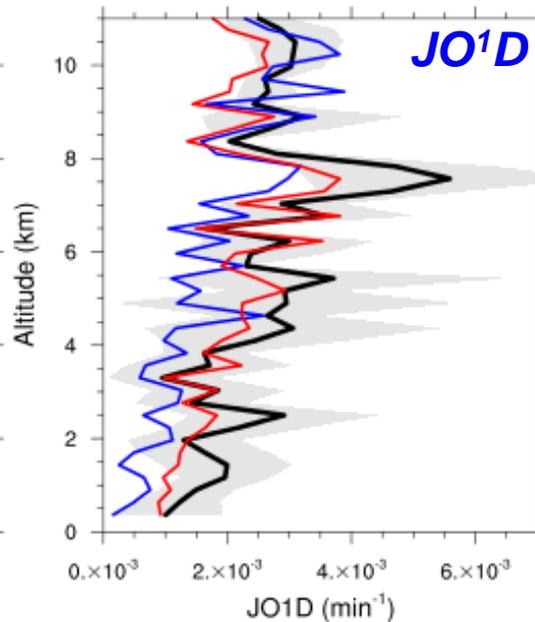

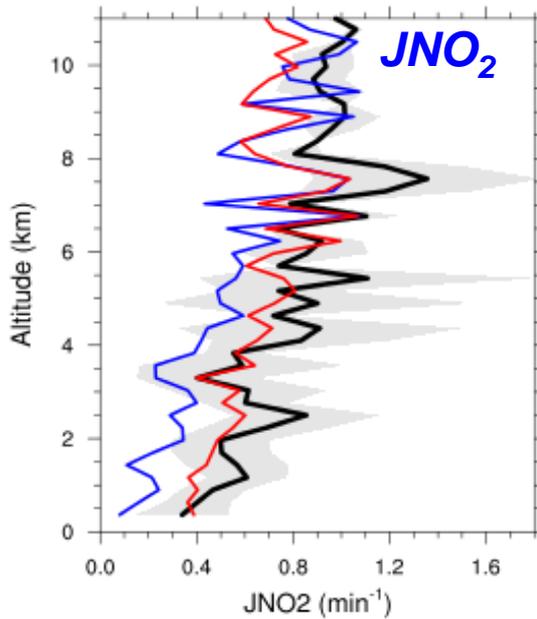

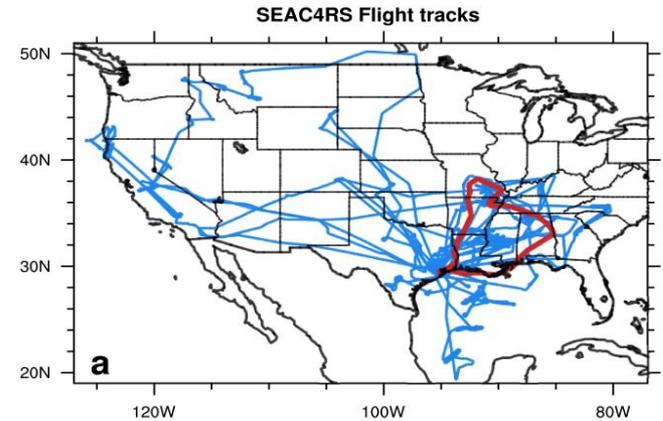

- phot_opt = 4, 4
- is_full_tuv = .false. : use wrf_tuv_xsqr.nc table interpolation
- is_full_tuv = .true. : use hard-coded data and formulas (updated)
- du_at_grnd = 300 : default total o3 column density
- has_o3_exo_coldens = .false. : o3 column density above 50 km = 0.
- has_o3_exo_coldens = .true. : o3 column density above 50 km from mozart climatology
- scale_o3_to_grnd_exo_coldens = .true. : total o3 column at ground scaled to climatology
- scale_o3_to_du_at_grnd = .true. : scaled to the du_at_grnd value at the ground
- pht_cldfrc_opt = 1 : grid cell cloud fraction is either 0 or 1
- pht_cldfrc_opt = 2 : grid cell cloud fraction varies between 0 and 1
- cld_od_opt = 1 : cloud optical depth is scaled by cloud fraction
- cld_od_opt = 2 : cloud optical depth is scaled by (cloud fraction)**1.5
